

WHERE DO FOREST BIRDS GO IN WINTER?

This map represents typical winter destinations of nine species that nest on Karl and Kathy Ross's 126-acre woodlot in Wallingford, Vermont.

The Ross property includes a mix of northern hardwood and red spruce/hemlock stands, and Karl and Kathy are managing their forest in part for bird habitat. They participate in "Woods, Wildlife and Warblers," a joint project of Audubon Vermont, The Vermont Tree Farm Committee, Vermont Woodlands Association and the American Forest Foundation.

For a video featuring the project, and a long-term migratory bird study at the Hubbard Brook Experimental Forest, check out northernwoodlands.org/resilient-forest
